

IN THE SPECIFICATION

Please replace the paragraph beginning at page 7, line 16 with the following:

The output of tuner 620 is also supplied to a sync separator 652. Sync separator 652 attempts to detect [[NTSC]]PAL vertical and/or horizontal synchronization pulses in the tuned signal. When synchronization pulses are detected, the pulses are transmitted to a signal controller 654. Signal controller 654 decides, based on whether sync pulses are detected and their repetition rates, whether or not to select the output of PAL rejection filter 640 as the output of MUX 660.
